FUSION BONDED EPOXY
CLASS A STEEL CONDUIT SYSTEM

FUSION BONDED EPOXY

THERMACOR’S FUSION BONDED EPOXY (FBE) coated Class A Steel Conduit System is Federal Agency Committee Approved for steam, condensate, and high temperature hot water systems. The system is professionally engineered as a complete system that is drainable, dryable, and air testable with total manufactured components: pipes, loops, elbows, tees, end seals, gland seals, and anchors. The system is built to withstand heavy traffic/earth loads, high water tables, and the most corrosive of soils.

FUSION BONDED EPOXY PIPE AND STRUCTURES COATING SPECIFICATIONS

DESCRIPTION
FUSION BONDED EPOXY is a primerless, one-part, heat-curable, thermostetting powdered epoxy coating designed to provide maximum corrosion protection to pipeline systems. A fusion bonded coating utilizes heat to melt and adhere the coating material to the metal substrate. It is a 100 percent solid, epoxy applied from the powdered state onto preheated pipe. The powder, when in contact with the hot pipe, melts, flows, and cures to a well-adhered, continuous, corrosion resistant coating.

PRODUCT PROPERTIES
- Impact (ASTM G14) 160 in-lbs
- Abrasion Resistance (ASTM D1044) 0,1144 g loss
- Adhesion to Steel (ASTM D1002) 6150 psi
- Penetration (ASTM G17) 0
- Tensile Strength (ASTM D2370) 9300 psi
- Elongation Compressive (ASTM D2370) 6.9%
- Thermal Shock (D695) No visible effect
- Thermal Shock 310° to -100°F 4x4 in coated panel 10 cycles
- Salt Fog (ASTM B117) 1000 hrs
- Salt Crock Disbondment Dia. 29 mm average
  90 day, 5 volt, 5% NaCl 24 mm average
  90 day, 1.5 volt, 3% ASTM G8 salt solution 31 mm average
  30 day, 5 volt, 5% NaCl sand crotck 230°F 26 mm average
  180 day, 1.5 volt, 3% ASTM G8 salt solution sand crotck 230°F panel temperature, 26 mil coating thickness 39 mm average
- Hot Water Resistance (212°F immersion 1000 hrs) - No blistering, good adhesion, slight discoloration, surface roughening and softening
- Color Blue Green

APPLICATION
The exterior surface of the pipe or structure to be coated shall be abrasive blasted to near-white metal with a nominal 2 mil anchor pattern.

The next step in the process is to uniformly heat the pipe to a temperature in the range of 450°F using a noncontaminating heat source. Three heating methods are used - electrical induction, gas fired forced air, and a combination of high velocity direct flame impingement and infrared. All of these methods are suitable providing the pipe is heated uniformly.

After the pipe has been heated to the proper temperature, it passes through powder coating machines where the fusion bonded epoxy coating is uniformly applied to the specified film thickness, min. 20 mils, using electrostatic deposition on the exterior and air spray on the interior of pipe. After application, the coating is allowed to cure using the residual heat in the pipe. During the curing process, the coated pipe should be carefully handled to avoid damage to the coating. After the coating has cured, the pipe can be force-cooled with air or water to facilitate inspection and handling.

INSPECTION
Coated pipe is electrically inspected using conventional search electrodes operating at 125 volts DC per mil of coating thickness. Small imperfections in the coating are repaired using hot melt patch sticks or two-part ambient curing liquid epoxy resins.

CATHODIC PROTECTION: FUSION BONDED EPOXY on steel is easily compatible with cathodic protection utilizing galvanic anodes or impressed current type systems.
SPECIFICATION GUIDE *

GENERAL
All piping to be installed as shown on plans shall be THERMACOR PROCESS INC. CLASS A STEEL manufactured pre-insulated conduit with all necessary pipe, loops, elbows, tees, seals, anchors, and other appurtenances as specified hereinafter and as recommended by the manufacturer.

CONDUIT
Conduit for all components shall be either electric resistance welded or spiral welded steel pipe conforming to ASTM specification A-134, A-135, and A-139. Conduit thickness shall be 10 ga. up through 26" diameter pipe and 6 ga. for 28" diameter and above.

Conduit shall be factory coated with fusion bonded epoxy, minimum 20 mils thick. Conduit straight lengths shall be normally fabricated in 40 foot nominal lengths with five pipe supports per length. Shorter lengths will be fabricated as required and provided with pipe supports not more than nine feet apart and with a pipe support not more than two feet from each end. Tees, anchors, elbows, and other fittings will be coated and pre-fabricated to straight sections whenever shipping requirements permit.

EXPANSION LOOPS, ELBOWS, AND ECCENTRIC FITTINGS
Expansion loops and elbows shall be factory manufactured utilizing the same casing thickness, material, and coating as the straight conduit lengths. Loops and elbows shall be sized to allow carrier pipe expansion without damage to the insulation. Eccentric fittings shall be factory manufactured, coated, and utilized whenever changes in casing size are required as determined by the manufacturer.

FIELD JOINTS
Field joints shall be applied by the installation contractor utilizing the manufacturer’s furnished kits and instructions. Field joints shall not be applied until after the carrier pipe has been hydrostatically tested and approved.

CATHODIC PROTECTION
Sacrificial galvanic anode cathodic protection systems are required in soils with resistivity readings less than 30,000 ohms/cm.

TERMINAL SECTIONS AND ANCHORS
Leak plates shall be 10 ga. steel plate conforming to ASTM A-36. End seals shall be of ½" steel plate conforming to ASTM A-36. Gland seals shall consist of a steel closure plate with stainless steel bolts and steel gland welded to a temperature resistant packing gland and a gland follower. Anchor sections shall be ½" steel plate conforming to ASTM A-36 steel with air passage holes and welded to carrier pipe and conduit.

CARRIER PIPE
Carrier pipe shall be as specified by the design engineer.

INSULATION
Insulation shall be mineral wool and shall be of a thickness as specified by the design engineer.

INSTALLATION
The installing contractor shall be responsible to excavate, string conduit, weld, test, place in trench, backfill, or otherwise treat and install the system as per directions furnished by the manufacturer and approved by the design engineer in accordance with the plans and specifications. The conduit shall be air tested at 15 psig for not less than two hours and the carrier pipe hydrostatically tested to 1½ times the working pressure for not less than four hours, or as specified by the engineer. Holiday testing of conduit coating shall be the responsibility of the contractor under the directions furnished by the manufacturer. All holidays shall be recoated and retested. A qualified representative of THERMACOR PROCESS INC. shall be present at the jobsite during critical periods of installation and testing. Backfill shall not commence until approval of tests by the THERMACOR PROCESS INC. representative. Field modifications must be approved by the manufacturer. The installing contractor shall certify that he has complied with the manufacturer’s directions.

* For alternate specifications, please contact THERMACOR.
**Pre-insulated Class “A” Steel Piping Systems with FBE coating** suitable for Steam, High Temperature Hot Water, Pumped Condensate and Gravity Condensate Service.

**Part 1 - General**

1. **Pre-insulated Piping** - Furnish a complete system of factory pre-insulated steel piping for the specified service. The piping system shall be of the drainable, dryable, testable type, suitable for all ground water and soil conditions, site Classification “A” (Federal Agency Guide Specification, UFGS-02552 & UFGS-02556). The system shall be provided as specified below and shown on the drawings.

2. **The pre-insulated pipe manufacturer shall make a complete layout of the system** showing anchors, expansion provisions, and building entrance details. Means for expansion must be made in pipe off-sets or loops unless this is compensated for integrally in the system.

3. **The system shall be Class “A” STEEL** as manufactured by Thermacor Process Inc. of Fort Worth, Texas.

**Part 2 – Products**

2.1 **The conduit** shall be 10 gauge, welded, smooth-wall black steel conforming to A-134, A-135, and A-136. Conduit shall be tested at the factory to insure air and watertight welds prior to any fabrication or application of coating. The outside conduit surface shall be blasted to clean, bright metal. Immediately after blasting, the outer conduit surface shall be given a factory coat of Fusion Bond Epoxy (FBE). Coating application shall be a minimum of 20 mils thickness.

2.2 **Conduit closures** shall be 10 gauge steel, furnished with the conduit at a ratio of one closure for each fabricated item or length. Closures shall be field welded over adjacent units after pipe insulation. After testing, all exposed closures shall be covered in the field with a heat shrinkable sleeve, furnished with the conduit.

2.3 **Piping in the conduit** shall be standard weight (Std. Wt. is the same as Sch. 40 through 10”) or extra strong (XS is the same as Sch. 80 through 8”), steel, ASTM A-53, Grade B, ERW or Sml. Pipe joints shall be welded in accordance with the Power Piping Code for ASME/ ANSI B 31.1.

2.4 **The pipe insulation** shall be mineral wool/ calcium silicate (or equal specified), of the thickness listed on the drawings.

2.5 **Pre-fabricated ells, loops, and tees** shall be furnished and installed where shown on plans and shall consist of pipe, insulation, and conduit conforming to the same specification as hereinbefore stated for straight runs. Expansion loops shall be designed in accordance with the stress limits indicated by the Code for Pressure Piping, ASME B31.1. Loop piping shall be installed in conduit suitably sized to handle indicated pipe movement.

2.6 **Terminal ends of conduits** inside manholes, pits, or building walls shall be equipped with end seals consisting of a 1/2” steel bulk head plate welded to the pipe and conduit. If there is no anchor within five feet of a terminal end, conduits shall be equipped with gland seals consisting of a packed stuffing box and gland follower mounted on a steel plate welded to the end of the conduit. End seals or gland seals shall be equipped with drain and vent openings. Terminate all conduits 2” beyond the inside face of manhole or building walls.

2.7 **Pre-fabricated anchors** shall be furnished and installed where shown on plans and shall consist of a steel plate, welded to pipe and conduit. The steel anchor plate shall be 1/2” thick and shall be 1-1/2” larger horizontally and 1-1/2” larger vertically than nominal conduit diameter.

2.8 **A concrete thrust block** shall be cast over the anchor plate and conduit, large enough for firm anchorage into undisturbed trench sidewalls and/or bottom. The concrete block shall be at least 36” in length and extend a minimum of 12” beyond the top and bottom of the anchor plate.

2.9 **Wall sleeves with leak plates** shall be provided at all building and manhole entries to provide an effective moisture barrier. The wall sleeve and leak plate shall be electrically isolated from building rebar. The space between the conduit and wall sleeve shall be made watertight by use of Link-Seal® pipe penetration seals or equal assemblies, which will also provide electrical isolation.
2.10 Cathodic protection shall be provided for the protection of the external surface of the conduit. The design Engineer shall furnish the soil resistivity for CP design purposes. The Cathodic protection system, complete with test stations, shall be designed for the particular site conditions. Cathodic protection drawings shall provide installation details, including anode location, test station location, wiring diagrams, electrical isolation, and cadwelding procedures. A CP Test report is to be furnished.

Part 3 – Execution

3.1 The installing contractor shall be responsible to excavate, string conduit, weld test, place in trench, backfill, or otherwise treat and install the system as per the specifications and the directions furnished by the manufacturer and approved by the design engineer in accordance with plans and specifications.

3.2 The conduit shall be air tested at 15 psi for two hours. Repair any carrier pipe leaks and retest prior to making field closure. Holiday testing of the conduit shall be the responsibility of the contractor under the directions furnished by the manufacturer. Holiday test the 20 mil fusion bond epoxy coating at 2500+/- 10%, volts. All holidays shall be recoated and retested.

3.3 A factory trained or qualified representative of Thermacor Process Inc. shall be present at the jobsite during critical periods of the installation such as unloading, commencement of the installation, and testing. Backfilling shall not begin until approval of pressure tests by the Thermacor field representative.

3.4 A hydrostatic pressure test of the carrier pipe shall be performed per the engineer’s specification with a factory recommendation of one and one-half times the normal system operating pressure for not less than two hours. Care shall be taken to insure all trapped air is removed from the system prior to the test. Appropriate safety precautions shall be taken to guard against possible injury to personnel in the event of a failure.
HEAT LOSS FOR STANDARD SIZES OF MINERAL WOOL*

- Burial depth: 36"
- Soil conductivity: 12 (Btu/h.ft²°F/ft)
- Soil temperature: 50°F

* Other pipe sizes and pipe, insulation thickness, and conduit size combinations are available.
GENERAL INSTALLATION INSTRUCTIONS

UNLOADING & HANDLING
Lift joints from trucks. DO NOT DROP SHARP OR HEAVY OBJECTS ON INSULATED UNITS. DO NOT use chains or other devices which might puncture insulation jacket.

STORAGE
Pipe is stockpiled off the ground. Do not exceed a stacking height of 6’. Prevent dirt and debris from entering pipe. Fittings, joining materials, etc. must be stored indoors to protect them from freezing, overheating, moisture, or loss.

LAYING OF PIPE UNITS – TRENCHING
All sharp rocks, roots, and other abrasive material must be removed from the trench. The trench bed should be 6” of sand or backfill as specified by the engineer, providing a smooth and uniform stabilizing surface (sandbags may be used as a means to keep pipe off the ground until backfilling is started). The trench width should provide a minimum of 6” from trench wall to jacket O.D. and a minimum of 6” between pipe units. Trench depths will be indicated on the contract drawing and in line with good construction practices. Trench depth should allow for a minimum cover of 24” on top of the insulated unit. Pipe is to be sloped 1” per 40’ towards the drains. Pieces that are marked top should have “top” up.

FIELD JOINING METHODS
Piping shall be joined in the field using approved methods of welding for appropriate pipe. Installation drawings will be provided to indicate location of each individual piece of pre-insulated pipe. Pre-insulated pipe will be marked with Job and Piece Number correlating to those on the installation drawings. Installation of pipe must follow the installation drawings. One end, and one end only, of conduit must have conduit sleeve. Shipping bars should be removed prior to welding. Care should be taken in removing shipping bars so as not to damage carrier pipe. Thermacor strongly recommends the use of a grinder when removing the bars from the carrier pipe. Field changes to fabricated units must be authorized in writing by the factory.

ANCHORS AND COLD SPRINGING
All carrier pipe welds, with the exception of the cold spring welds, should be made and anchors poured prior to the cold springing. Anchors should be 1’ above, 1’ below, and 3’ in length, extending into the undisturbed dirt of the trench wall. Cold springing is to be performed per the Engineer’s instructions and as shown on the installation drawings. Bridging the conduit may be used when circumstance does not allow traditional methods.

TESTING
The hydrostatic pressure test shall be performed per the engineer’s specification with a factory recommendation of one and one-half times the normal operating pressure for not less than two hours. Inspect all welds at this time. Appropriate safety precautions shall be taken to guard against possible injury to personnel in the event of a failure.

INSULATION
Joints should be insulated after the hydro-test to the thickness and material specified, making sure that the insulation is cut to length and secured with two stainless steel bands, as provided. The insulation and/or the inside of the conduit must be kept dry during the entire insulation process.

CASING SLEEVES
Sleeves are welded and air tested at 15 psi for two hours. After testing, sleeves are to be cleaned of any weld splatter and either coated, heat shrink is applied, or both.

HOLIDAY TESTING
Conduit should be holiday tested right before backfill or earlier if pipe is handled with care. Pipe should be holiday tested at the required voltage for the particular coating. Make any repairs with the patch sticks provided. (Larger repairs can be made with liquid coating from Thermacor.)

CATHODIC PROTECTION
Cathodic protection should be installed right before backfill, per the instructions of the corrosion engineer.

BACKFILL FINAL
Before backfilling is started, the trench should be cleaned of any trench wall cave-ins and general trash, especially metal. Backfilling should be done with sand or other engineer-approved material 6” below the casing to 1” above. Engineer-approved backfill may be used to fill the rest of the trench. This material should be free of rocks, roots, large clods, or anything that could cause damage to the casing or casing coating. Casing should have a minimum of 2’ cover.

WHEELED OR TRACKED VEHICLES SHALL NOT BE USED FOR TAMPPING!
SHIPPING & HANDLING INSTRUCTIONS

HANDLE COATED PIPE WITH EXTRA CARE! THIS PIPE CAN DAMAGE WHEN HANDLED, MOVED, OR STORED IMPROPERLY!

UPON RECEIPT OF MATERIALS
Make an overall inspection of the load, checking all bands and braces to see if they are intact. Also, check the load for shifting. If the load has shifted, or if the braces and bands are broken, examine each pipe for damage. HAVE THE TRUCK DRIVER MAKE AN ITEMIZED NOTATION OF ANY DAMAGE ON THE DELIVERY RECEIPT AND HAVE IT SIGNED BY THE DRIVER.

CHECK PACKING LIST
Compare materials received with those listed on the packing list. Count all pipe and boxes. NOTE ANY SHORTAGES ON DRIVER’S DELIVERY RECEIPT.

CHECK BOXES
Open all boxes and inspect for damages, shortages, and incorrect size. REPORT ANY DISCREPANCIES WITHIN 30 DAYS AFTER RECEIPT.

CLAIMS FOR DAMAGES
Claims for damages in transit or lost goods must be made within 30 days. The filing of any claim is the Purchaser’s Responsibility. Thermacor will file any claim on Purchaser’s behalf upon receipt of the following:
1. Written authority to file such a claim.
2. Written notice of loss or damage (signed and noted Bill of Lading) by truck driver or carrier freight agent.

UNLOADING PIPE
Pipe may be unloaded by hand or with fork lifts*, cherry pickers, or cranes. DO NOT HOOK pipe ends. Minimum 4” wide straps or slings should be used.

*Fork Lift – When using Fork Lift, wide tines or a large surface covering the fork tines must be used to prevent coating damage. Fork Lift must be able to handle the weight of the insulated pipe length.

PIPE STOCKPILING
Pipe should be stored on level ground, elevated to be as dry as possible, and in such a way that the pipe ends do not lie in water or on the ground. To prevent deformation of the jacket and insulation due to the weight of the pipe, place a series of supports (3 for 20’ or 5 for 40’) of ample size generally constructed from 2” x 4”s under the pipe as shown below. Supports should increase in width as weight load increases so that the top supports of a fully loaded stockpile should be approximately 10” wide, gradually increasing to the bottom level, approximately 18” wide. Pipe can be pyramided (within reasonable and safe limits) approximately 6’ high after a properly braced or chocked base is formed. Pipe stored outside for long periods of time can be covered with blue mesh tarpaulin (plywood can also be used). Do not prevent airflow as jacket can be deformed from heat buildup.

BE VERY CAREFUL NOT TO DROP THE PIPE!

NOTE: Thermacor does not approve of the practice of installing pipe and fittings, and backfilling the pipe before testing. Thermacor will not allow or pay claims for charges which arise in locating and digging up leaks regardless of cause.
The above thicknesses will support a highway loading H-20, or equivalent, with a minimum of 2' burial and 95% of maximum density compacted backfill in cohesive soils or 70% of relative density compacted backfill for cohesive soils. For special loadings and soil conditions, conduit thickness may change.
